Interfaces

Abstract class

Enumeration

Relationships :-

① Dependency (Weakest) -- use -->

② Association

- Association means one class knows about another and holds a reference to it as a field.
 "has-a" or "uses-a"

③ Aggregation

- When one class contains another, but the contained objects have their own independent lifecycle and can be shared across multiple containers.

④ Composition

- When the part has no independent identity or purpose outside the whole, the whole controls the part's entire lifecycle.

⑤ Inheritance (Generalization)

"is-a" relationship where a subclass extends a super class, inheriting its attributes and methods. The subclass can add its own fields and methods, and can override inherited behavior.

① Realization (Implementation)

- Realization is the relationship between a class and an interface it implements. The class promises to provide concrete implementations of all methods declared in the interfaces.
