

Use Case Diagram.

A use case diagram is a behavioral diagram from UML that shows the interactions between external entities (called actors) and the functionality a system provides (called use cases).

Building blocks of a use case Diagram

① Actors

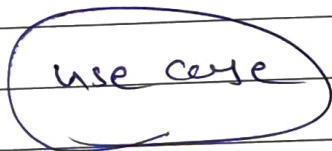

- An actor is anything that interacts with the system from outside.

- Primary actors.
- secondary actors.

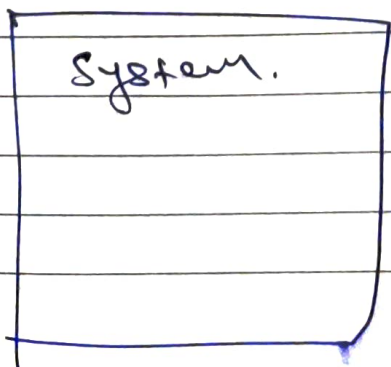

② Use cases

- A use case is a specific goal or function that the system provides to an actor.

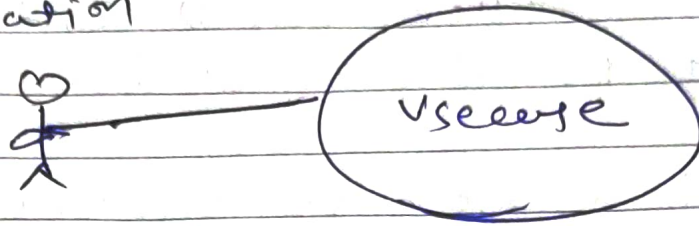

③ System boundary

- The system boundary is a rectangle that encloses all the use cases. It visually defines what's inside your system and what's outside. The system name is written ~~on~~ at the top of the rectangle.

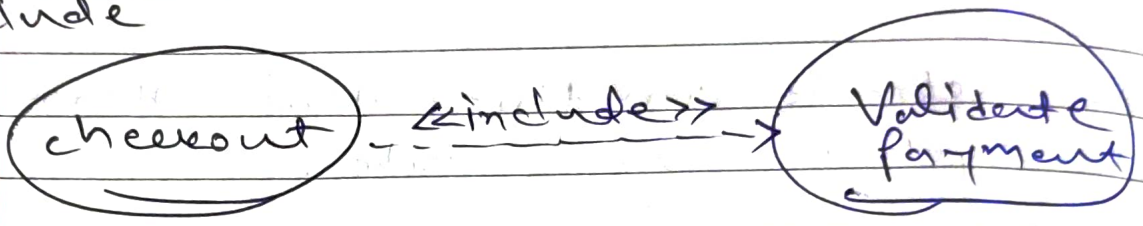

⑤ Relationships

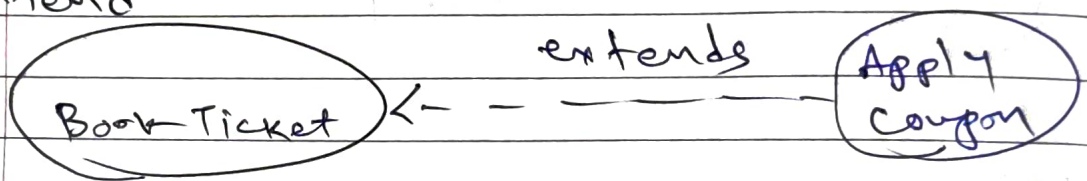

a. Association

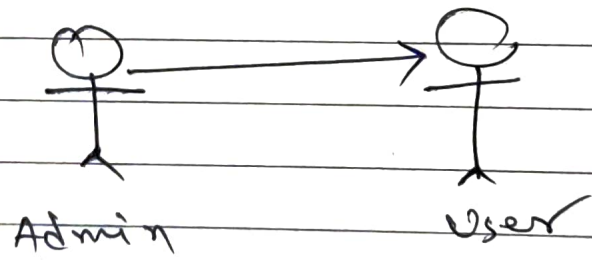

b. Include

c. Extend

d. Generalization

⇒ steps to build / draw use case diagrams.

① Identify Actors.

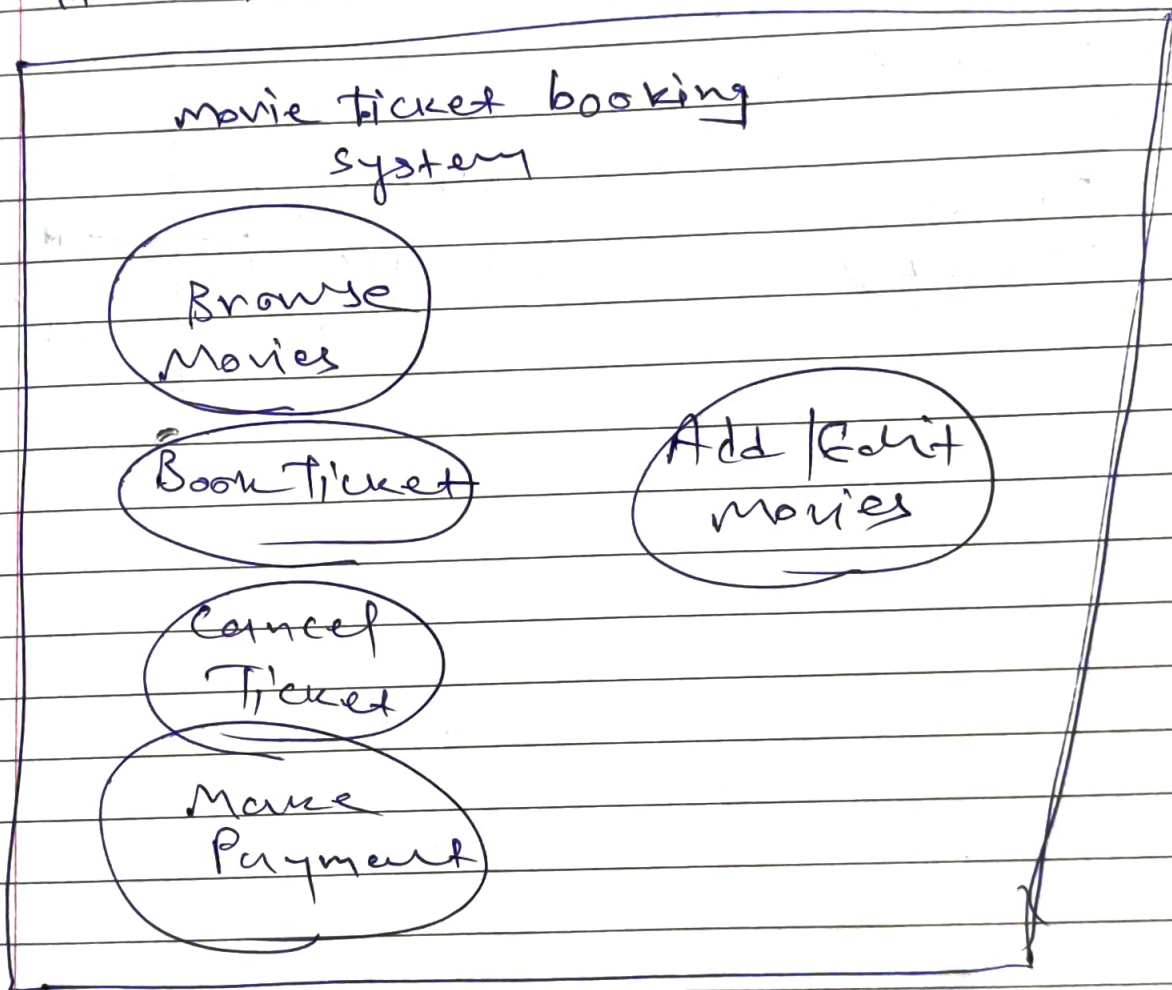

- customer (P)
- Admin (P)
- Payment Gwy (S)

2) List the use cases

- customer - Browse movies, Book Ticket, Cancel Ticket, View Booking history
- Admin - Add movies, update showtime
- System-level - Process Payment (called during booking)

3) Define the system boundary

- Draw a box around all the use cases and label it with the name of your system.

4) Draw Associations.

5) Add Include, Extend and Generalization Relationships

6)

Movie Ticket Booking System
